EXPERIMENT 3

Client-Side Form Validation using JavaScript and Regex

AIM

To validate user inputs on the client side using JavaScript and regular expressions.

ALGORITHM

1. Create a registration form with name, email and phone fields.
2. Capture the form submit event.
3. Prevent submission until validation is complete.
4. Check each field using regular expressions.
5. Display a success or error message.

PROGRAM

```
<!DOCTYPE html>
<html><body>
<h2>Registration Form</h2>
<form id="form">
<input id="name" placeholder="Name" required><br><br>
<input id="email" placeholder="Email" required><br><br>
<input id="phone" placeholder="10-digit phone" required><br><br>
<button>Register</button>
</form>
<p id="msg"></p>
<script>
document.getElementById('form').onsubmit=e=>{
 e.preventDefault();
 const n=document.getElementById('name').value.trim();
 const m=document.getElementById('email').value;
 const p=document.getElementById('phone').value;
 const email=/^[^\s@]+@[^\s@]+\.[^\s@]+$/;
 const phone=/^[0-9]{10}$/;
 const msg=document.getElementById('msg');
 if(!n || !email.test(m) || !phone.test(p))
   msg.textContent='Enter valid details.';
 else msg.textContent='Form submitted successfully!';
};
</script></body></html>
```

RESULT

Thus, client-side form validation was implemented successfully using JavaScript and Regex.

VIVA QUESTIONS

1. What is form validation?
2. What is the difference between client-side and server-side validation?
3. What is a regular expression?
4. Why is preventDefault() used?
5. What does the test() method do?
